## *What are Snap-In Dentures?*

Snap-in Dentures, also known as implant retained dentures, are a hybrid between traditional dentures and dental implants. They involve placing implants into the jaw, which serves as an anchor for a denture that “snaps” into place. There are many benefits such as:

**Stability:** Won't slip or shift while eating or speaking

**Removable:** Easy for cleaning and maintenance

**Cost-Effective:** Generally less expensive than a full set of dental implants

**Functionality:** Improves chewing and speech more than traditional dentures

## *Thing to Consider*

**Still Removable:** Some people prefer a permanently-fixed solution

**Requires Adjustment:** The attachment may wear over time and need to be replaced

**Periodic Relining:** Like all dentures, the fit may change as the bone structure changes over time
